BS8007 was supported by CIRIA 91 which provided background to the design method and data for use in the design process. This has been updated and replaced by CIRIA C660 which brings the design into line with the Euro-codes and provides current information required to support the design process.

CIRIA C660- Early-age Thermal Crack Control in Concrete

Abstract This paper provides a brief overview of the updated version of the CIRIA C660 guide on control of thermal cracking, which has been used extensively in the UK and is also popular across...

Sparing everyone the queries..Ciria C660 is necessary to limit crack widths and for other reasons. In my case, I have determined from Ciria that I need diameter 12 bars at 150mm centres. From what I have read, Ciria C660 appears to cater only for reinforcement on each face since the formula for Asmin is based on h/2.

Concrete Cracking and CIRIA C660 - Structural engineering ...

CIRIA C660 proposes the expression $c_r = r \cdot 0.5 \cdot c_{tu}$ i.e. r less the residual strain in the concrete after cracking. (This approach is also taken by BD28.) (This approach is also taken by BD28.) In each case the assumption is that the crack width is strain limited.

Managing urban flooding from heavy rainfall - encouraging the uptake of designing for exceedance: 29/04/2014: C738. Designing for exceedance enables better management of local flood risk and surface water by creating safe and resilient flood routes, temporary storage areas and making use of other measures to reduce the impact of flooding.

According to CIRIA C660, the restraint factors given by BS 8110-2 and HA BD 28/87 reflects true restraint values, while the restraint factors from BS 8007 and EN 1992-3 has a modification factor of 0.5 to account for creep under sustained loading.

This title is included in CIRIA's PDF book sale. Click on the pdf option below to order your copy. Following the high profile gas explosions at Loscoe and Abbeystead during the 1980s, a number of reports were published in the 1990s on the measurement of ground gases, the assessment of risk such gases may present along with the measures that can ...

A new CIRIA guide C766 is coming to the market soon. It is to replace the super popular guide C660 – early age crack control for water retaining structures. I feel privileged to be one of its first users and have been able to achieve massive saving in reinforcement, in the magnitude of millions in £ term, by using this guide.

In accordance with CIRIA C660, the restraint factors introduced by BS 8110-2 and HA BD 28/87 reveals perfect restraint values, whereas the restraint factors from BS 8007 and EN 1992-3 contains a modification factor of 0.5 to take into account creep under sustained loading.

Apart from the savings and changes, does C766 provide any further clarification and guidance compared to C660? Yes – I have noticed some below: 1. It offers clarifications on restraint factors calculation method. Further guidance on restraint conditions: thermal performance for ground slabs have been separated from walls.
