This handbook is designed primarily for the practising engineers engaged in design of machine foundations. It covers basic fundamentals for understanding and evaluating dynamic response of machine foundation systems with emphasis is on detailed dynamic analysis for response evaluation. Use of commercially available Finite Element packages, for analysis and design of the foundation, is recommended.

The design of a machine foundation is generally made by idealizing the foundation- soil system as spring-mass -dashpot model having one or two degrees of freedom. Most machine foundations are treated as surface footing and the soil spring and damping values are determined using the elastic-half space analog.

FOUNDATIONS FOR INDUSTRIAL MACHINES AND EARTHQUAKE EFFECTS. Improvement in manufacturing technology has provided machines of higher ratings with better tolerances and controlled behaviour. These machines give rise to considerably higher dynamic forces and thereby higher stresses and, in return, demand improved performance and safety leaving no room for failures.
