The term was retroactively coined in contrast to reduced instruction set computer (RISC) and has therefore become something of an umbrella term for everything that is not RISC, from large and ...

A superscalar processor is a CPU that implements a form of parallelism called instruction-level parallelism within a single processor. In contrast to a scalar processor that can execute at most one single instruction per clock cycle, a superscalar processor can execute more than one instruction during a clock cycle by simultaneously dispatching multiple instructions to different execution units on the processor. It therefore allows for more throughput than would otherwise be possible at a given

CPU - this allows you to have single instructions that perform multiple actions. Now you've gone from executing one instruction per 5 clock cycles to executing multiple complete instructions per 1 clock cycle. In the best case, the CPU lights up like a christmas tree - every single unit active at the same time, all the time.

Multiple Instruction Issue. Multiple instructions issued each cycle • a processor that can execute more than one instruction per cycle •issue width= the number of issue slots, 1 slot/instruction • not all types of instructions can be issued together • an example: 2 ALUs, 1 load/store unit, 1 FPU 1 ALU does shifts & integer multiplies, the other executes branches Motivation: better performance • increase instruction throughput • decrease in CPI (below 1) Cost: greater ...

Try running this silly piece of code: You will see it print 'start func1' and then 'start func2' and then after a (very) long time you will finally see the functions end. But they will indeed execute simultaneously. Because processes take a while to start up, you may even see 'start func2' before 'start func1'.

A grant of probate can be issued to one executor, or any other number up to a maximum of four. If the will names more than four executors then some of those people must either choose to renounce their right to apply, or choose to reserve their right to apply. The reservation is made by signing a document known as a 'power reserved' letter.

There is no such thing as a single thread running on multiple cores simultaneously. It doesn't mean, however, that instructions from one thread cannot be executed in parallel. There are mechanisms called instruction pipelining and out-of-order execution that allow it.
