The prenatal human cranium deals with the development of the human cranium before birth. It is divided into two parts, one focusing on normal development and the other on pathologic development. In a systematic, atlas-like section on normal development, an account is given of where, when and how bone development takes place both within the individual bones and as regards the developmental sequence among the bones.

This union marks the beginning of the prenatal period, which in humans encompasses three distinct stages: (1) the pre-embryonic stage, the first two weeks of development, which is a period of cell division and initial differentiation (cell maturation), (2) the embryonic period, or period of organogenesis, which lasts from the third to the eighth week of development, and (3) the fetal period, which is characterized by the maturation of tissues and organs and rapid growth of the body.

**prenatal development | Description, Stages, & Timeline ...**

Prenatal development (from Latin natalis 'relating to birth') includes the development of the embryo and of the fetus during a viviparous animal's gestation.Prenatal development starts with fertilization, in the germinal stage of embryonic development, and continues in fetal development until birth.. In human pregnancy, prenatal development is also called antenatal development.

The smallest circumference, corresponding to the plane of the suboccipitobregmatic diameter, is 32 cm. The bones of the cranium are normally connected only by a thin layer of fibrous tissue that allows considerable shifting or sliding of each bone to accommodate the size and shape of the maternal pelvis. This intrapartum process is termed molding.

**Fetal head - Wikipedia**

You can find out about all these and read about your baby's development in our week-by-week pregnancy content. You can also see a slideshow of what's happening to your baby each week. Before you get pregnant. ... At 14 weeks, the baby is about 85mm long from head to bottom.

Fetal Stage . Once cell differentiation is mostly complete, the embryo enters the next stage and becomes known as a fetus. The fetal period of prenatal develop marks more important changes in the brain. This period of development begins during the ninth week and lasts until birth. This stage is marked by amazing change and growth.

Fontanelles are a regular feature of infant development in which two segments of bone remain separated, leaving an area of fibrous membrane or a "soft spot" that acts to accommodate growth of the brain without compression by the skull. Of the six fontanelles in the human skull, the anterior fontanelle, located between the frontal and parietal bones, serves as an important anatomical diagnostic tool in the assessment of impairments of the skull and brain and allows access to the brain and ...

**Musculoskeletal System - Skull Development - Embryology**

The head and neck is not really a "system", but structurally quite different in origin from the body. The head and neck are one of the most complicated structures that the embryo forms, with special intermediate structures (the pharyngeal arch) and contributions from all 3 embryonic layers (ectoderm, mesoderm, endoderm), and significantly, a major contribution from the neural crest.

**Head Development - Embryology**

Signs and symptoms of microcephaly may include a smaller than normal head circumference that usually remains smaller than normal as the child grows, dwarfism or short stature, delayed motor and speech functions, mental retardation, seizures, facial distortions, hyperactivity, balance and coordination problems, and other brain-related or neurological problems; although some with the disorder may develop normal intelligence.
